JM Two-Part Urethane Insulation Adhesive – Canister Shelf-Life Increase

Johns Manville would like to bring your attention to two notable changes impacting our JM Two-Part UIA adhesive canisters:

1. The standard shelf-life for JM Two-Part UIA canisters is now 16 months vs. the 12-month shelf-life previously published. This is based on historical storage and performance data, there has been no change to the formulation. This is effective for all new product with a manufacture-date of 3/3/23 or later. Existing product is still subject to the previous 12-month shelf-life. Please note this is specific to canisters and does not affect other packaging types. Cartridges, 5 gallon bag-in-box, and 15 gallon & 50 gallon drums will continue to have a shelf-life of 18 months.
2. The label indicating shelf-life is changing to reflect the date of manufacture, an expiration date will no longer be provided. To determine the canister expiration date simply add 16 months to the manufacture date on the label (see image).

Thank you for your continued business and support of JM products. Please contact your JM Representative with any questions.
